GXFSH$ - Flush GX Type-Ahead Buffer

The GXFSH$ routine is used to flush the type-ahead buffer maintained by GX.

1. Invocation

To flush the GX type-ahead buffer code:

```
CALL GXFSH$
```

2. STOP Codes and Exception Conditions

No STOP codes are generated by GXFSH$.

No exceptions are returned by GXFSH$.

3. Programming Notes

GXFSH$ is only available when running on GX. Any attempt to use GXFSH$ on a non-GX terminal will be ignored.

This routine is considered highly-specialised and should not be required for most applications.

4. Examples
