GXGCN$ - Get Windows Computer Name from GX PC

The GXGCN$ routine can be used to obtain the Windows computer name from the GX PC.

1. Invocation

To obtain the Windows computer name code:

```
CALL GXGCN$ USING name
```

where *name* is a PIC X(100) field into which the Windows computer name is returned.

2. STOP Codes and Exception Conditions

The following STOP codes may be generated by GXGCN$:

STOP code	Description
14203	GXGCN$ has been called by an application that is not running on GX

No exceptions are returned by GXGCN$.

3. Programming Notes

GXGCN$ is only available when running on GX. Any attempt to use GXGCN$ on a non-GX terminal will result in a STOP code.

The Windows computer name is **NOT** terminated with a byte of binary-zero. If the Windows computer name is less than 100 characters, the remainder of the PIC X(100) field is SPACE filled.

4. Examples

[EXAMPLES REQUIRED]

5. Copy-Books

None.
