

## GX Search Buttons

GX Search Buttons are special Speedbase buttons that are appended to a normal field and displayed in the form of an <F1> drop-down.

A Search Button is identified by a "normal" button (i.e. BTN type) with text-string consisting of a single "#" character. The button field must be placed at exactly the same start location as the associated field. The data field **MUST** be a non-scrolled item. For example:

13 02 DATE	D	NSC
13 02 "#"		BTN U50

The Search Button is handled as any other general-purpose button (i.e. the function number must be trapped in the R-FUNC routine, and can be enabled/disabled as required).

## Version Requirements

GX V3.2
