

LIBI\$ - Copy Library Index Routine

The LIBI\$ system routine is used to read the Library Index containing the names and starting positions of the books in a Global Cobol copy library. The \$COPLB development utility is used to append a Library Index to the text of a Copy Library file.

Important Note: The Copy Library Index, and thus LIBI\$, have been removed in GSM V8.1. The feature was only required during \$COBOL compilations when copy libraries were held on slow access devices (e.g. diskettes). The Copy Library Index is not supported by \$SDL, \$SDL32 or \$COMPILE.
