RENAX$ - Rename Windows File

The RENAX$ routine can be used to rename a Windows file on the server running the Global Client.

1.　Invocation

To rename a file code:

```
CALL RENAX$ USING path new-path
```

where *path* is a LOW-VALUES terminated string containing the file name and path of the file to be renamed and *new-path* is a LOW-VALUES terminated string containing the new file name and path.

2.　STOP Codes and Exception Conditions

No STOP codes are generated by RENAX$.

The following EXIT codes may be returned by RENAX$:

EXIT code	$$COND	Description
25101	1	A Unix error was returned by the RENAX$ routine. The Unix error code is available in the $$CRES System Variable.
25102	2	A Windows error was returned by the RENAX$ routine. The Windows error code is available in the $$CRES System Variable.

3.　Programming Notes

The file to be renamed must be closed on entry to RENAX$.

If the directory in the new file path is different from the original directory then the file will be moved to the new directory.

Note the difference between RENAX$ and RENAT$: Both parameters for RENAX$ are LOW-VALUES terminated strings containing the file name and path of the file to be renamed. The first parameter for RENAT$ is an FD; only the second parameter is a LOW-VALUES terminated string containing the file name and path.

4.　Examples

None.

5.　Copy-Books

None.
